# PROJECT INFORMATION

Project name	ROCIN-ECO
Project duration	01.10.2021 – 30.06.2024 (30 months)
Project lead	IONITY GmbH
Project Partner	IONITY GmbH, AUDI AG, TÜV SÜD
Associated Partner	Porsche AG, BMW AG, Ford AG, AVL GmbH, Huber+Suhner AG, ROCSYS
Short description	<p><b>ROCIN-ECO – Robot Charging Infrastructure Ecosystem enabling carefree mobility across Europe</b></p> <p>The goal of ROCIN-ECO is the development and demonstration of an interoperable, standardized, automated charging solution by means of a robot. Since the automated charging solution must be fully interoperable with both the charging infrastructure and e-vehicles, success can only be achieved with a coherent, integrated approach that involves standardization activities throughout the whole project. Our realization will be the only vendor-independent solution with a strong focus on non-discrimination and standardization. The practice-oriented approach by considering public use cases as well as a safe soft-robot technology and high charging performance confirm the difference of ROCIN-ECO from other projects. Respecting multiple aspects for automated charging we claim to find the optimal technology for enabling carefree mobility across Europe.</p>

## ASSOCIATED PARTNERS

+ offen für weitere Partner

# ROCIN-ECO - INTRODUCTION

1. Understanding the ACDS process and technology
2. Provide recommendations towards standardization

## Method

Get close to a standardizable process, with available means.

1. Choosing and  
Navigating  
to service site

2. Entering service  
site

3. Approaching and  
Parking at the  
automatic EVSE

4. Docking

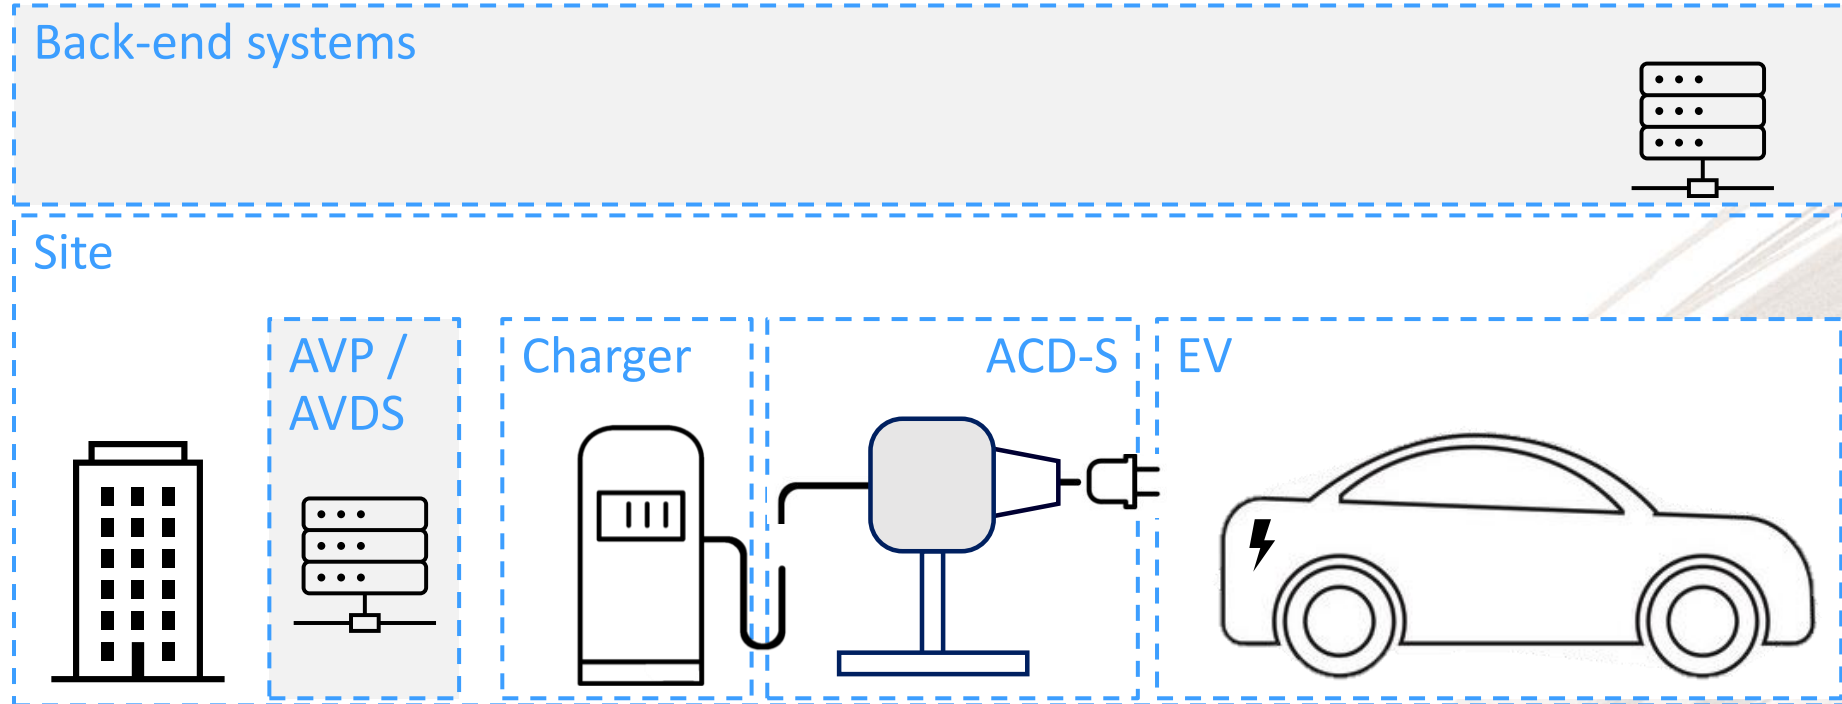

5. Energy transfer

6. Undocking

7. Leaving the  
automatic EVSE

## Method

Get close to a standardizable process, with available means.

# ROCIN-ECO - LEARNING BY DOING

## First steps

Apr. 2022

## Where are we now

Nov. 2023

# ROCIN-ECO - LEARNING BY DOING

Try out user stories and parking layouts

Jun. 2022

Test communications for a fully automated process

Jan. 2023

Installation of final demonstrator

Nov. 2023

Apr. 2022

Test physically plugging in and out.

Oct. 2022

Integrate infrastructure components  
Simulate user story for the automated process

Jun. 2023

Test complete user story

## Testing plugging in and out

- Provide demarcated parking spot
- Provide clearance between parking spot and arm

## Try out user stories and parking layouts

- Front/reverse parking is most repeatable
- Only a noteworthy hazard while plugging in

Gefördert durch:

aufgrund eines Beschlusses  
des Deutschen Bundestages

## Integrate infrastructure components & Simulate user story for the automated process

- Charging process can remain as is (with Plug n Charge, or preauthorization)
- Pre-charge checks take the most time
- Parking based on ranging feedback is more difficult than parking based on lines

## Test communications for a fully automated process

- Limited information exchange needed to execute process
- Most information exchange would take place in preparation of arrival

NextGenerationEU

aufgrund eines Beschlusses  
des Deutschen Bundestages

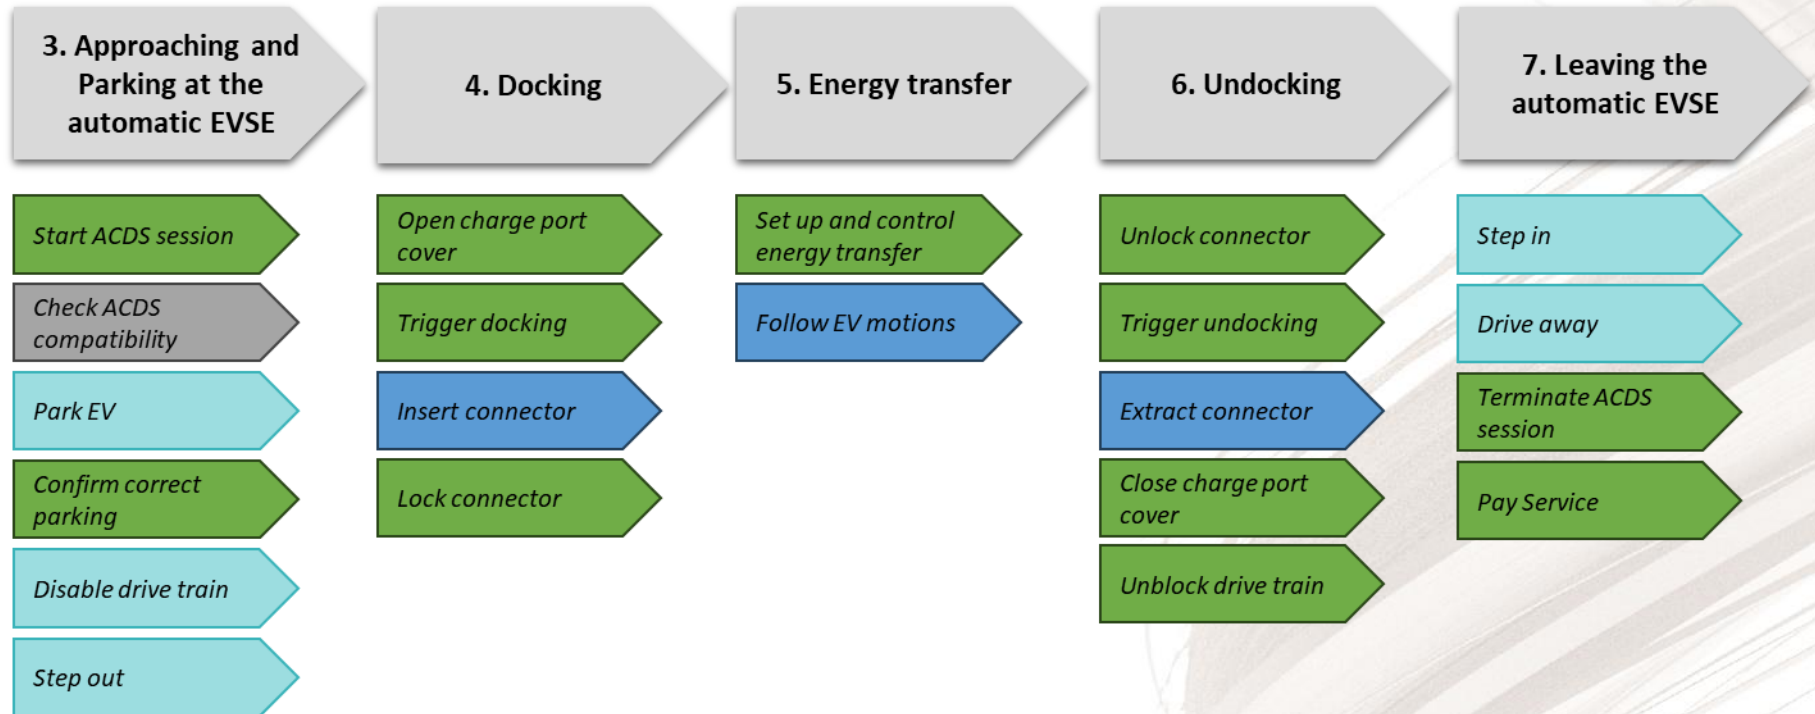

## Validate complete user story

- Setting up of BLE communication when coming in range is fast and reliable enough for ACDS
- UWB (CCC implementation): at least sufficient for confirming position pairing of EV-aEVSE, further investigation ongoing ...

# ROCIN-ECO – THE FINAL DEMONSTRATOR

## Demonstrate user story

- EV actions
- ACDS actions
- Human
- N/A

# ROCIN-ECO – ACD STANDARDS IN PROGRESS

 = ROCIN - ECO Contribution

## **EV requirements**

- The EV can put its inlet it within the mating space.
- EV is off when the ACD is active
- It's the EV's responsibility to make the inlet accessible.
- Interlock mechanisms are only engaged when the ACD is not active

## **aEVSE requirements**

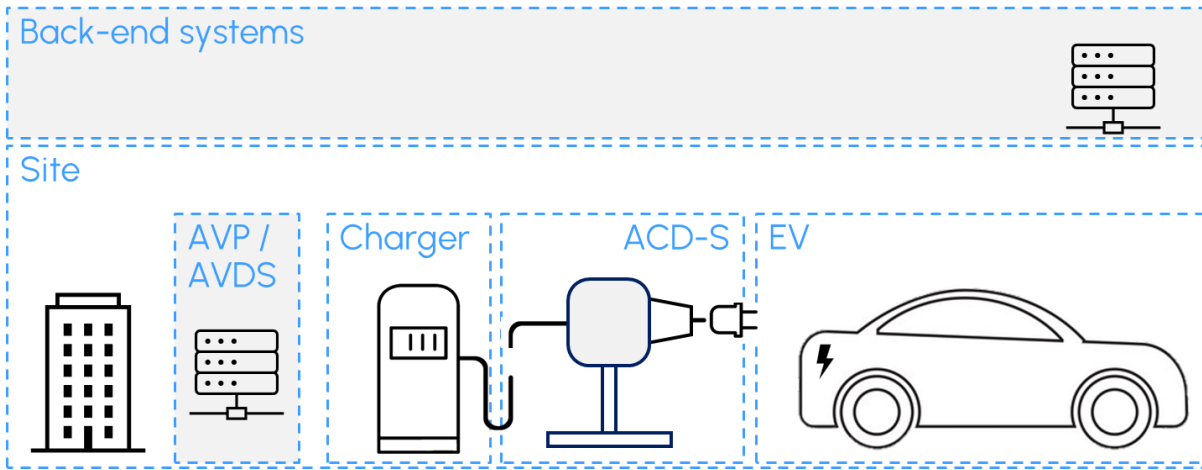

- Safety for clamping hazard
- Inlet detection not depending on vehicle
- Charging process remains unchanged
- Follow passive vehicle motions
- Use of space standardizable, via physical parking features (marking/bumps/etc.)
- Provide a barrier crossing

## **Communication**

- Direct communication and ranging via BLE/UWB via CCCv3, or indirect via backend
- Preparation via backend systems

1. Understanding the ACDS process and technology
2. Provide recommendations towards standardization

1. Choosing and Navigating to service site

2. Entering service site

3. Approaching and Parking at the automatic EVSE

4. Docking

5. Energy transfer

6. Undocking

7. Leaving the automatic EVSE
